

Mineral Bolus

Mineral Bolus in combination
with the Repidose Bolus

Mineral Boluses in combination with the Repidose Bolus

Those who want to deworm their young cattle and also want to be ensured of the right minerals and dietary elements during the summer opts for:

Mineral Bolus in combination with the Repidose Bolus

This combination gives you no need to worry about young cattle in the field of deworming and mineral supply.

Ruminants in the pasture usually have a shortage of dietary elements such as copper, cobalt, zinc, selenium and iodine.

This is reflected in every autumn including:

1. A disappointing growth
2. Increased number of returnees
3. Mastitis in cows

This can be prevented by providing cattle the UNO Grow bolus.

The benefits from the UNO Grow bolus are:

- * Optimal growth, development and fertility
- * Provides cattle 6 important minerals and 4 essential vitamins in one treatment
- * Guaranteed controlled release per day
- * 6 months active (=180 days)
- * Labor saving
- * Researched and proven
- * Nothing remains inside the animal

The many benefits from the deworming Repidose Bolus are :

- * In the grazing season young cattle will be protected against all worms (stomach, colon, and lung ribbon worms)
- * Sequential release system, deworming every 21 days (Cycle worm)
- * Immunity-building for next coming season
- * Optimal growth, performance and yield (up to 49 kg extra)
- * Operation is individual, one bolus deworms 5 times
- * Each grazing area is suitable

The best deworming, growth and optimal fertility are also the key points you are striving for in young cattle?

**Choose the strength of the combination:
Repidose + UNO Grow**

The perfect combination!

**The ideal combination of resistance
and protection for young cattle
in the pasture!**

**Uno Grow
With an additional
high proportion of
Selenium & Vit. E**
