

# Mineral Bolus

## What is a Mineral Bolus?

### What is a mineral bolus?

De mineral bolus is a slow-release bolus that contains dietary elements and vitamins. Depending on which bolus you choose, the bolus will work for 4 or 6 months.

### Always use 2 boluses!

This is the reason to always use two boluses:

-Two boluses give a higher release per day, which covers the supplementary demand.

-Two boluses are needed so that the boluses rub against each other to obtain it's optimal release.

### What does the bolus look like:

A mineral bolus is a kind of bullet cartridge with a diameter of about 27 mm and a length of about 67 mm. The mineral bolus has the shape of a compressed cylinder with an uniform density (2.48) which is coated. If the bolus is continuously dissolving, the polymer coating will break down on the active end to maintain a constant open surface. A fully soluble weight is located in the bolus. This weight improves the density, reducing the chance of belching, so that this substantially does not occur.

### What does the bolus do?:

The mineral bolus ensures that the animal will receive a constant replenishment of dietary elements and vitamins in the daily feed ration.
